

Right material for the product

Posted by bcn0209 - 2012/01/01 14:40

Choosing what material is the right one for a part is always difficult when your first learning about 3D printing. The companies offering consumers and pro-summers (designers and artists like you) don't provide enough information for you to make n educated decision about what material is the best for your project or product. There are lots of things about each material to know...not something that you can look at a chart to Lerner about.

Use kraftwurx new learning center and forums to Lerner about 3D printing materials and technology with material information, videos and more.

Amile,

What is it that you want to 3d print. I can help guide you in material selection.
