

## Bio Compatible Materials Foodsafe?

Posted by rachel.fine - 2012/02/08 11:12

---

Hello, I was wondering if the bio-compatible materials could be considered food safe? The medical specs are listed but there is no mention of whether cups bowls plates and the like can be printed and used safely in these materials.

The bio-compatibles are made for direct contact with skin or wounds for prolonged periods of time. Is it Food Safe?, For now the short answer is No. Kraftwurx chooses not deem any materials "food-safe" that have not been tested and determined to be so by the FDA or CFSAN.

Now with that said. Obviously some materials such as stainless steel, ceramics, and bio-compatible could very well hold food/liquid safely. It is just that 3d printed forms of these materials have not been fully tested for use with foods.
